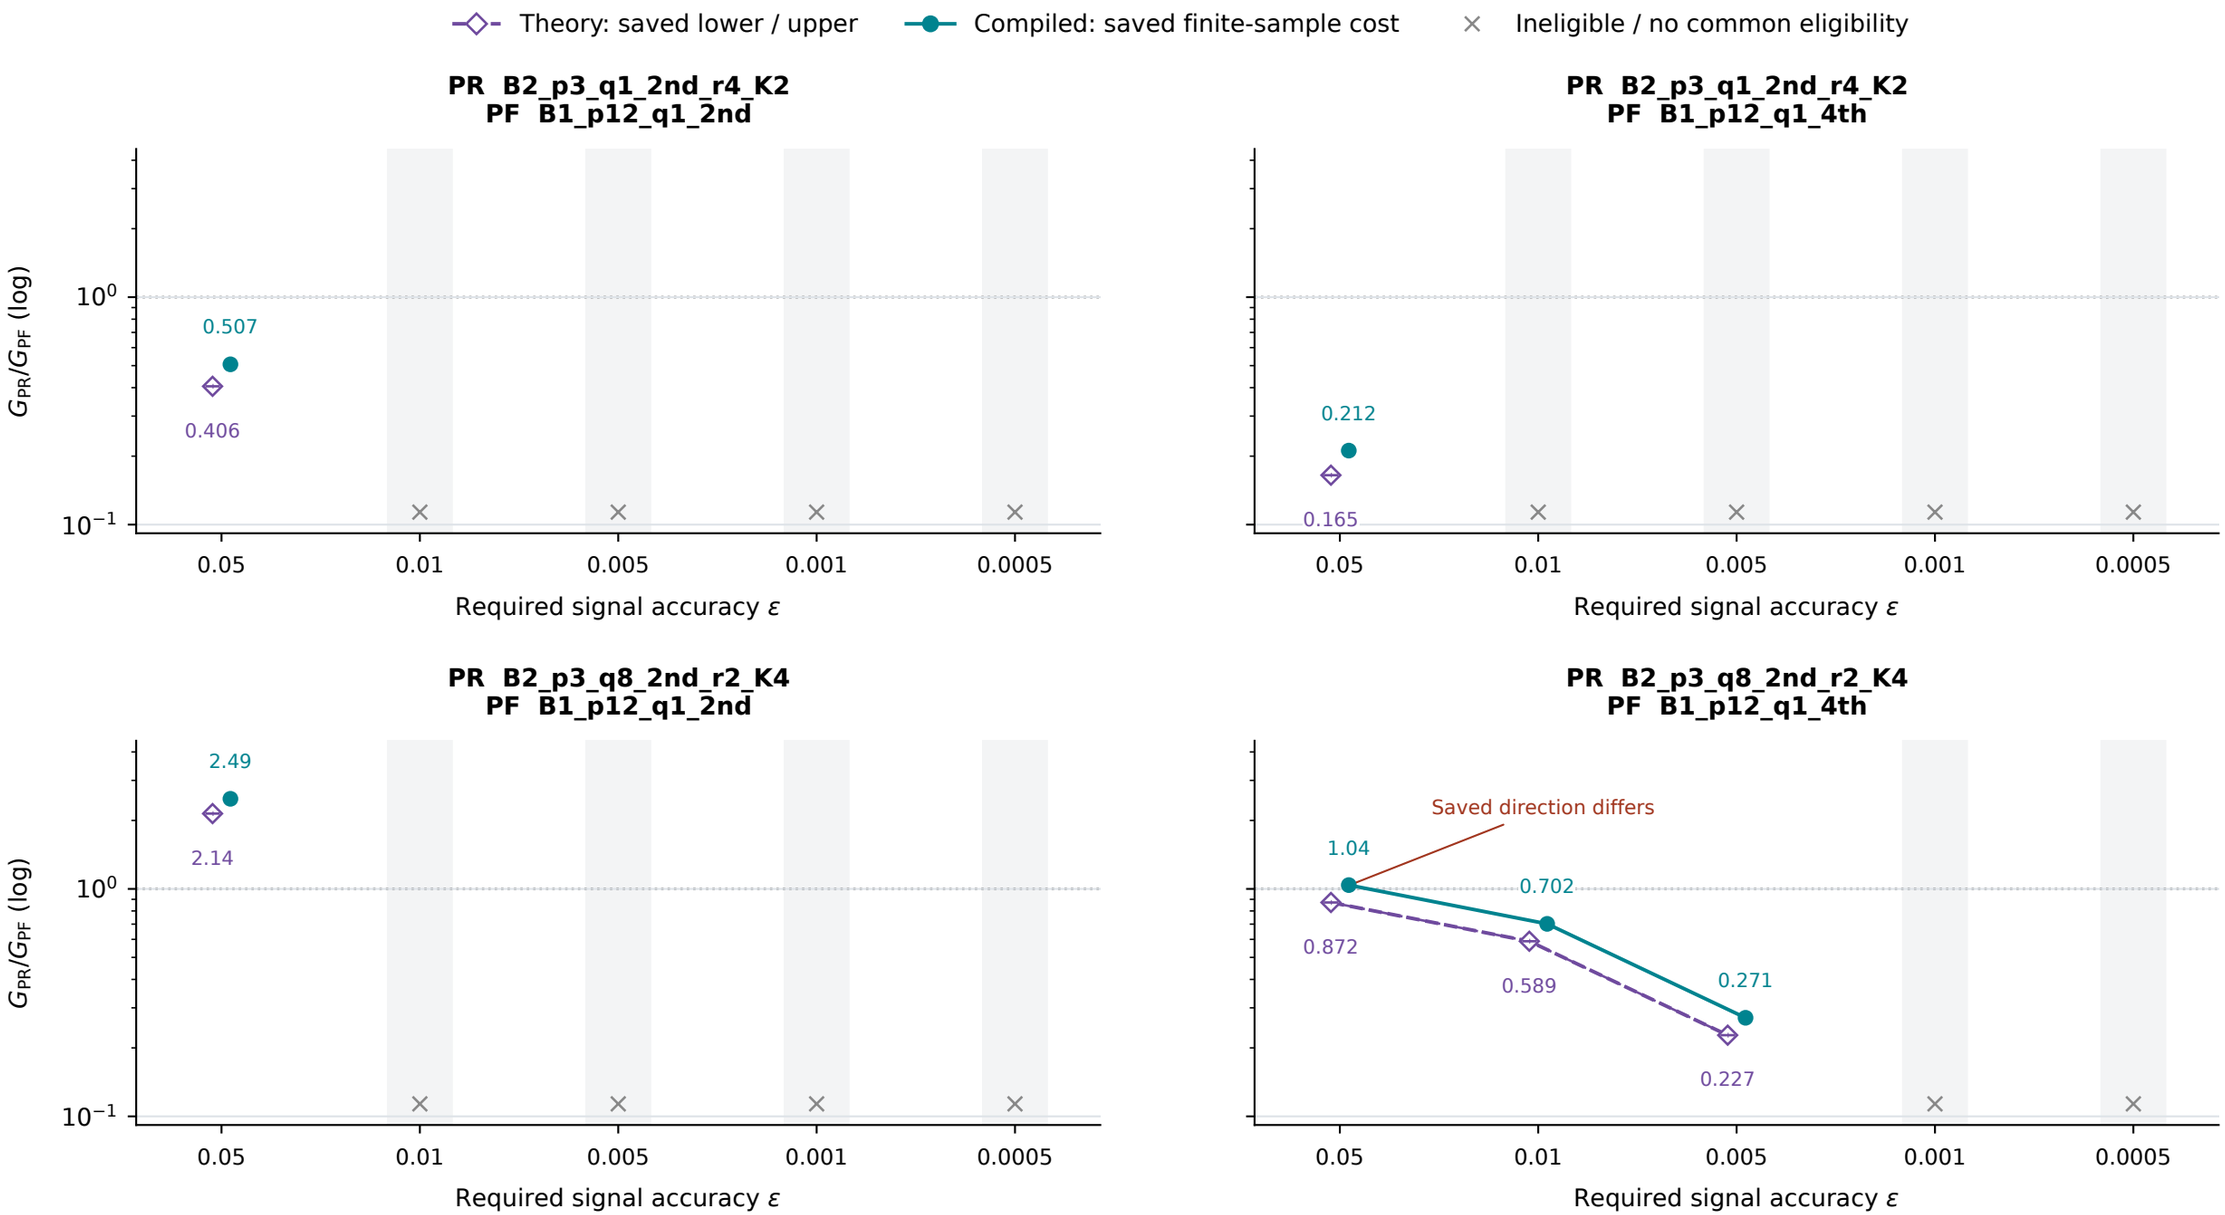
H4 | PR / PF shot-inclusive RZ cost ratio

legacy DF12 · PR anchor n=32 | NATIVE_MIXED | allowance factor 1 | S4 corrected



Linear 1 Å / STO-3G; T=0.8; P=0; cos+sin full Hadamard wrapper; saved empirical shots for each candidate.
Theory is an expected cost under the declared model; compiled PR is a finite-sample mean. No CI or population guarantee.
Lower/upper are stored endpoints, not a confidence interval. Gaps are saved ineligibility; no values are filled.
RZ only; excludes state preparation and FTQC. Ratio < 1 favours PR; > 1 favours PF.
